Introduction

Introduction

Context

- ▶ Exact linear algebra: over a field \mathbb{K} , (sometimes a ring \mathbb{R} or \mathbb{Z})
- ▶ Mostly algebraic complexity, counting field operations, (sometimes bitcomplexity)

Problem

Given $\mathbf{M} \in \mathbb{K}^{m \times m}$, compute $\chi_{\mathbf{M}} = \det(x\mathbf{I}_m - \mathbf{M}) \in \mathbb{K}[x]$.

Applications

- ▶ Matrix invariants (eigenvalues, invariant factors), test for similarity
- ▶ Invariant subspace decomposition
- ▶ Gröbner basis (change of ordering)
- ▶ Modular forms (action of the Hecke Operator)

A challenging complexity problem: dense linear algebra over a field

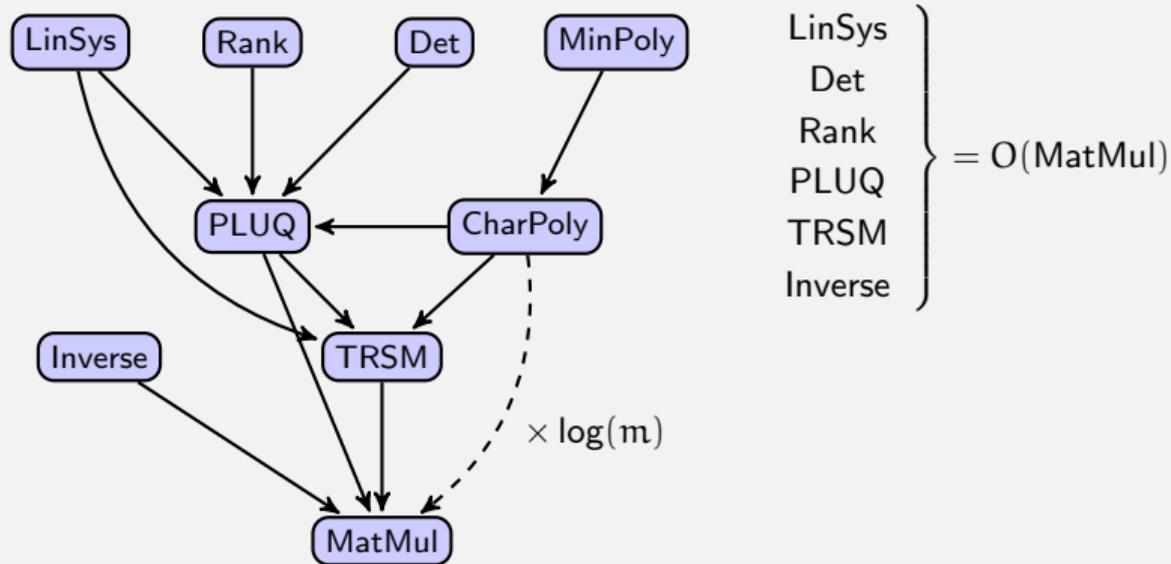

Dense linear algebra: **reductions** of most problems to matrix multiplication

ω : a feasible exponent of MatMul over \mathbb{K} : $m \times m$ by $m \times m$ in $O(m^\omega)$

A challenging complexity problem: dense linear algebra over a field

Dense linear algebra: **reductions** of most problems to matrix multiplication

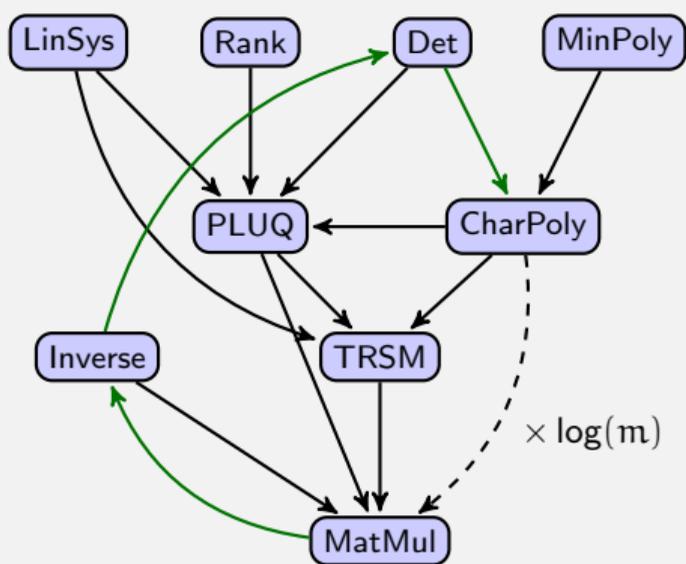

ω : a feasible exponent of MatMul over \mathbb{K} : $m \times m$ by $m \times m$ in $O(m^\omega)$

A challenging complexity problem: dense linear algebra over a field

Dense linear algebra: **reductions** of most problems to matrix multiplication

ω : a feasible exponent of MatMul over \mathbb{K} : $m \times m$ by $m \times m$ in $O(m^\omega)$

LinSys
Det
Rank
PLUQ
TRSM
Inverse

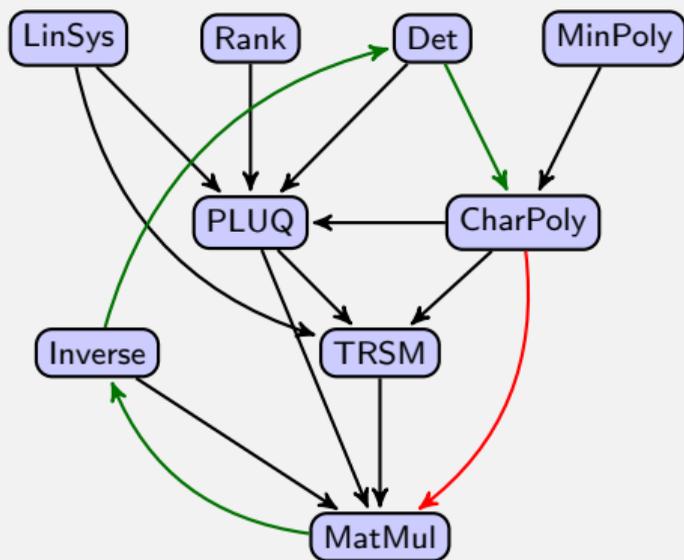

} = $O(\text{MatMul})$

$\text{MatMul} = O \left(\begin{array}{c} \text{Det,} \\ \text{PLUQ,} \\ \text{CharPoly,} \\ \text{Inverse} \end{array} \right)$

} = $O(\text{MatMul})$

$\text{MatMul} = O \left(\begin{array}{c} \text{Det,} \\ \text{PLUQ,} \\ \text{CharPoly,} \\ \text{Inverse} \end{array} \right)$

Challenge: $\text{CharPoly} = O(\text{MatMul})$?

A challenging complexity problem: sparse/structured linear algebra over a field

Sparse matrices via black-box methods

- ▶ Only operation: $\text{Mat} \times \text{Vect} \rightarrow \text{Cost: } E$

A challenging complexity problem: sparse/structured linear algebra over a field

Sparse matrices via black-box methods

- ▶ Only operation: $\text{Mat} \times \text{Vect} \rightarrow \text{Cost: } E$
- ▶ [Wiedeman 86]: $\text{Minpoly}(m) = O(mE + m^2)$

A challenging complexity problem: sparse/structured linear algebra over a field

Sparse matrices via black-box methods

- ▶ Only operation: $\text{Mat} \times \text{Vect} \rightarrow \text{Cost: } E$
- ▶ [Wiedeman 86]: $\text{Minpoly}(m) = O(mE + m^2)$
- ▶ [Villard 01]: $\text{Charpoly}(m) = O(m^{1.5}E + m^{2.5})$

A challenging complexity problem: sparse/structured linear algebra over a field

Sparse matrices via black-box methods

- ▶ Only operation: $\text{Mat} \times \text{Vect} \rightarrow \text{Cost: } E$
- ▶ [Wiedeman 86]: $\text{Minpoly}(m) = O(mE + m^2)$
- ▶ [Villard 01]: $\text{Charpoly}(m) = O(m^{1.5}E + m^{2.5})$
- ▶ [Villard 03]: $\text{Charpoly}(m) = O(m^{2.36})$
when $E = O(m)$

Challenge: Blackbox methods \ll Dense methods

A challenging complexity problem: sparse/structured linear algebra over a field

Sparse matrices via black-box methods

- ▶ Only operation: $\text{Mat} \times \text{Vect} \rightarrow \text{Cost: } E$
- ▶ [Wiedeman 86]: $\text{Minpoly}(m) = O(mE + m^2)$
- ▶ [Villard 01]: $\text{Charpoly}(m) = O(m^{1.5}E + m^{2.5})$
- ▶ [Villard 03]: $\text{Charpoly}(m) = O(m^{2.36})$
when $E = O(m)$

Challenge: Blackbox methods \ll Dense methods

Matrices with rank displacement structure

- ▶ Toeplitz, Hankel, Cauchy, Vandermonde, etc
- ▶ Generalization: $\text{rank}(\Delta(\mathbf{A})) = \alpha \ll m$
- ▶ [Bostan-Jeannerod-Mouilleron-Schost 17]
 $\text{LinSys, Det, Inverse} = O^{(\sim)}(m\alpha^{\omega-1})$
- ▶ until recently: $\text{Charpoly} = O(m^2\alpha^{\omega-1})$

Challenge: Charpoly in sub-quadratic time in m ?

Outline

Introduction

Via Krylov methods

- Keller-Gehrig's algorithm

- An implicit Krylov method

Via polynomial matrix arithmetic

- Overview of the approach

Open problems

Via Krylov methods

Iterates of one vector

For a vector $\mathbf{v} \in \mathbb{K}^m$, let

$$\mathbf{K} = [\mathbf{v} \quad \mathbf{A}\mathbf{v} \quad \dots \quad \mathbf{A}^{d-1}\mathbf{v}].$$

If d is maximal s.t. \mathbf{K} full-rank, then

$$\mathbf{A}\mathbf{K} = \mathbf{K} \underbrace{\begin{bmatrix} 0 & & & p_0 \\ 1 & & & p_1 \\ & \ddots & & \vdots \\ & & 1 & p_{m-1} \end{bmatrix}}_{C_p}$$

and $P = X^m - p_{m-1}X^{m-1} - \dots - p_0$ is the minpoly of \mathbf{v} wrt. \mathbf{A} .

Iterates of one vector

For a vector $\mathbf{v} \in \mathbb{K}^m$, let

$$\mathbf{K} = \begin{bmatrix} \mathbf{v} & \mathbf{A}\mathbf{v} & \dots & \mathbf{A}^{d-1}\mathbf{v} \end{bmatrix}.$$

If d is maximal s.t. \mathbf{K} full-rank and $d = m$, then

$$\mathbf{K}^{-1}\mathbf{A}\mathbf{K} = \underbrace{\begin{bmatrix} 0 & & & p_0 \\ 1 & & & p_1 \\ & \ddots & & \vdots \\ & & 1 & p_{m-1} \end{bmatrix}}_{C_P}$$

and $P = X^m - p_{m-1}X^{m-1} - \dots - p_0$ is the minpoly of \mathbf{v} wrt. \mathbf{A} .

then $\chi_{\mathbf{A}} = P$

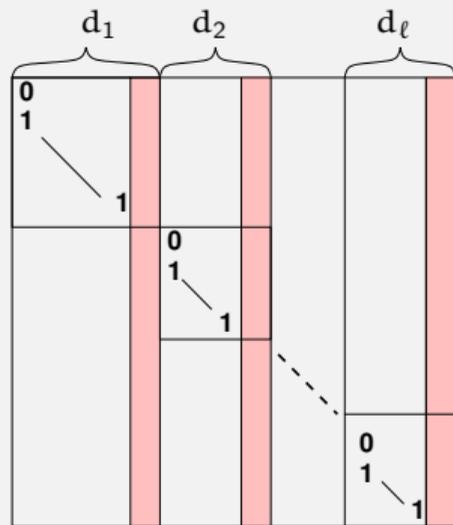

Krylov Methods

Iterates of multiple vectors

For a family of vectors $\mathbf{v}_1, \dots, \mathbf{v}_\ell \in \mathbb{K}^m$, let

$$\mathbf{K} = \left[\begin{array}{c|c|c|c|c|c} \mathbf{v}_1 & \mathbf{A}\mathbf{v}_1 & \dots & \mathbf{A}^{d_1-1}\mathbf{v}_1 & \mathbf{v}_2 & \dots & \mathbf{A}^{d_2-1}\mathbf{v}_2 & \dots & \mathbf{v}_\ell & \dots & \mathbf{A}^{d_\ell-1}\mathbf{v}_\ell \end{array} \right].$$

If \mathbf{K} is invertible then $\mathbf{K}^{-1}\mathbf{A}\mathbf{K} =$

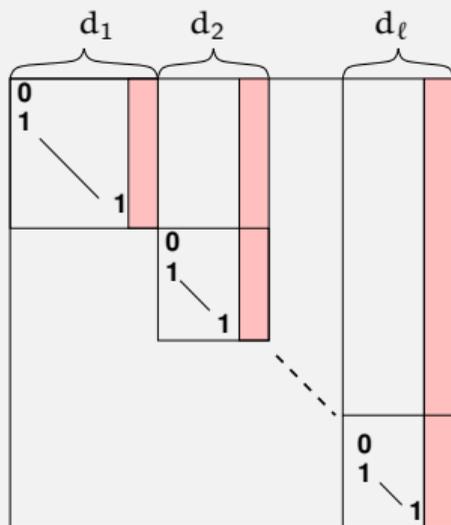

Krylov Methods

Iterates of multiple vectors

For a family of vectors $\mathbf{v}_1, \dots, \mathbf{v}_\ell \in \mathbb{K}^m$, let

$$\mathbf{K} = \left[\begin{array}{c|c|c} \mathbf{v}_1 & \mathbf{A}\mathbf{v}_1 & \dots & \mathbf{A}^{d_1-1}\mathbf{v}_1 & \mathbf{v}_2 & \dots & \mathbf{A}^{d_2-1}\mathbf{v}_2 & \dots & \mathbf{v}_\ell & \dots & \mathbf{A}^{d_\ell-1}\mathbf{v}_\ell \end{array} \right].$$

If \mathbf{K} is invertible and (d_1, \dots, d_ℓ) is **lexico. maximal** then $\mathbf{K}^{-1}\mathbf{A}\mathbf{K} =$

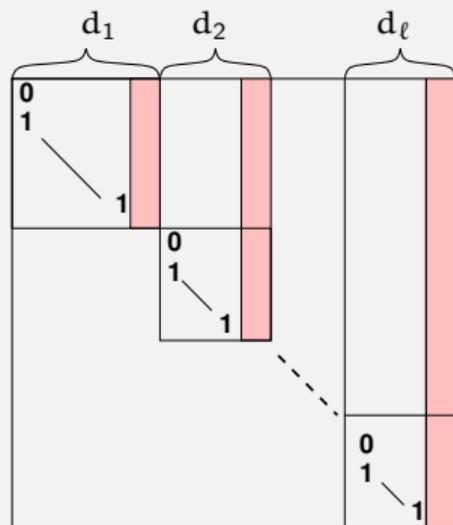

Krylov Methods

Iterates of multiple vectors

For a family of vectors $\mathbf{v}_1, \dots, \mathbf{v}_\ell \in \mathbb{K}^m$, let

$$\mathbf{K} = \left[\begin{array}{c|c|c} \mathbf{v}_1 & \mathbf{A}\mathbf{v}_1 & \dots & \mathbf{A}^{d_1-1}\mathbf{v}_1 & \mathbf{v}_2 & \dots & \mathbf{A}^{d_2-1}\mathbf{v}_2 & \dots & \mathbf{v}_\ell & \dots & \mathbf{A}^{d_\ell-1}\mathbf{v}_\ell \end{array} \right].$$

If \mathbf{K} is invertible and (d_1, \dots, d_ℓ) is lexico. maximal then $\mathbf{K}^{-1}\mathbf{A}\mathbf{K} =$

Then

$$\chi_{\mathbf{A}} = P_1 \times \dots \times P_\ell$$

where C_{P_i} is the i -th diagonal block

Approach 1: computing the Krylov matrix

1. Compute $\mathbf{K} = \left[\begin{array}{c|c|c|c|c} \mathbf{v}_1 & \mathbf{A}\mathbf{v}_1 & \dots & \mathbf{A}^{d_1-1}\mathbf{v}_1 & \mathbf{v}_2 & \dots & \mathbf{A}^{d_2-1}\mathbf{v}_2 & \dots & \mathbf{v}_\ell & \dots & \mathbf{A}^{d_\ell-1}\mathbf{v}_\ell \end{array} \right]$.
2. Compute $\mathbf{H} = \mathbf{K}^{-1}\mathbf{A}\mathbf{K}$ → $O(m^\omega)$

Approach 1: computing the Krylov matrix

1. Compute $\mathbf{K} = \left[\mathbf{v}_1 \quad \mathbf{A}\mathbf{v}_1 \quad \dots \quad \mathbf{A}^{d_1-1}\mathbf{v}_1 \mid \mathbf{v}_2 \quad \dots \quad \mathbf{A}^{d_2-1}\mathbf{v}_2 \mid \dots \mid \mathbf{v}_\ell \quad \dots \quad \mathbf{A}^{d_\ell-1}\mathbf{v}_\ell \right]$.
2. Compute $\mathbf{H} = \mathbf{K}^{-1}\mathbf{A}\mathbf{K}$ $\rightarrow O(m^\omega)$

Iteratively

Using m Matrix-Vector products (+ Gaussian elimination) $\rightarrow O(m^3)$

Approach 1: computing the Krylov matrix

1. Compute $\mathbf{K} = \left[\mathbf{v}_1 \quad \mathbf{A}\mathbf{v}_1 \quad \dots \quad \mathbf{A}^{d_1-1}\mathbf{v}_1 \mid \mathbf{v}_2 \quad \dots \quad \mathbf{A}^{d_2-1}\mathbf{v}_2 \mid \dots \mid \mathbf{v}_\ell \quad \dots \quad \mathbf{A}^{d_\ell-1}\mathbf{v}_\ell \right]$.
2. Compute $\mathbf{H} = \mathbf{K}^{-1}\mathbf{A}\mathbf{K}$ → $O(m^\omega)$

Iteratively

Using m Matrix-Vector products (+ Gaussian elimination) → $O(m^3)$

[Keller-Gehrig 85]'s iteration (adaptation of square & multiply)

- ▶ Iteratively compute ($\log_2 m$ iterations)

- ◊ $\mathbf{K}_0 \leftarrow \left[\mathbf{v}_1 \quad \dots \quad \mathbf{v}_\ell \right]$

- ◊ $\mathbf{K}_1 \leftarrow \left[\mathbf{K}_0 \quad \mathbf{A}\mathbf{K}_0 \right]$

- ◊ ...

- ◊ $\mathbf{K}_i \leftarrow \left[\mathbf{K}_{i-1} \quad \mathbf{A}^{2^i}\mathbf{K}_{i-1} \right]$

- ▶ Interleave Gaussian elimination to discard linearly dependent columns
→ each \mathbf{K}_i has no more than m columns

Approach 1: computing the Krylov matrix

1. Compute $\mathbf{K} = \left[\mathbf{v}_1 \quad \mathbf{A}\mathbf{v}_1 \quad \dots \quad \mathbf{A}^{d_1-1}\mathbf{v}_1 \mid \mathbf{v}_2 \quad \dots \quad \mathbf{A}^{d_2-1}\mathbf{v}_2 \mid \dots \mid \mathbf{v}_\ell \quad \dots \quad \mathbf{A}^{d_\ell-1}\mathbf{v}_\ell \right]$.
2. Compute $\mathbf{H} = \mathbf{K}^{-1}\mathbf{A}\mathbf{K}$ → $O(m^\omega)$

Iteratively

Using m Matrix-Vector products (+ Gaussian elimination) → $O(m^3)$

[Keller-Gehrig 85]'s iteration (adaptation of square & multiply)

- ▶ Iteratively compute ($\log_2 m$ iterations)

- ◊ $\mathbf{K}_0 \leftarrow \left[\mathbf{v}_1 \quad \dots \quad \mathbf{v}_\ell \right]$

- ◊ $\mathbf{K}_1 \leftarrow \left[\mathbf{K}_0 \quad \mathbf{A}\mathbf{K}_0 \right]$

- ◊ ...

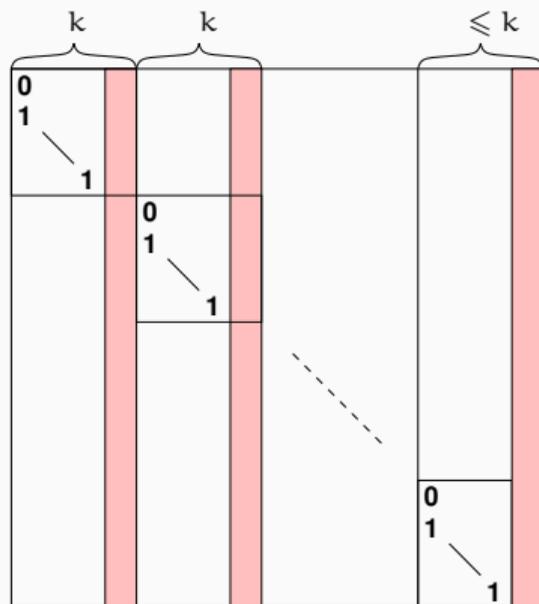

- ◊ $\mathbf{K}_i \leftarrow \left[\mathbf{K}_{i-1} \quad \mathbf{A}^{2^i}\mathbf{K}_{i-1} \right]$

- ▶ Interleave Gaussian elimination to discard linearly dependent columns
→ each \mathbf{K}_i has no more than m columns

→ $O(m^\omega \log m)$

Approach 2: avoid computing the Krylov matrix [P. Sturlach 37]

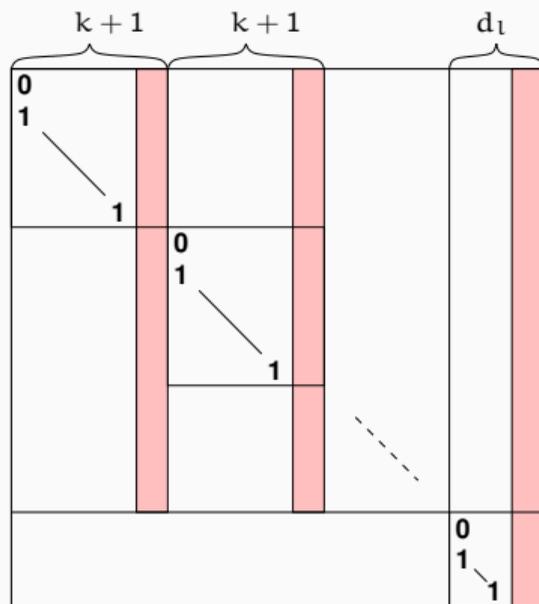

k-shifted form:

- ▶ Any matrix is in 1-shifted form

Approach 2: avoid computing the Krylov matrix [P. Storjohann 37]

$k + 1$ -shifted form:

- ▶ Any matrix is in 1-shifted form

Approach 2: avoid computing the Krylov matrix

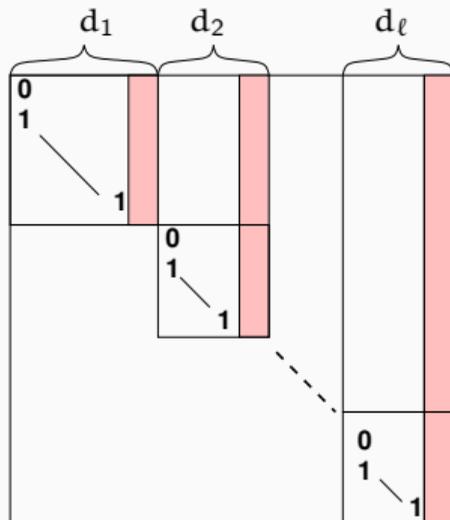

- ▶ Compute iteratively from 1-shifted form to d_1 -shifted form

Approach 2: avoid computing the Krylov matrix

- ▶ Compute iteratively from 1-shifted form to d_1 -shifted form
- ▶ each diagonal block appears in the increasing degree

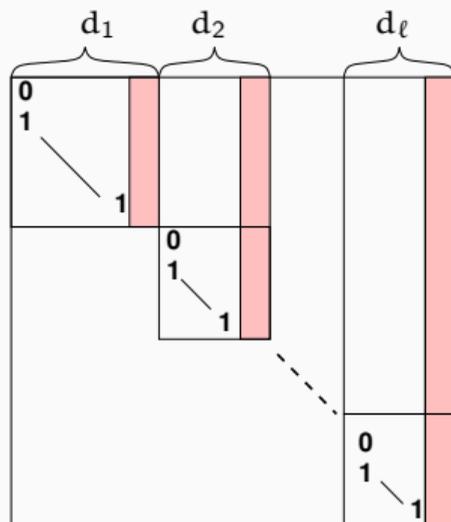

Approach 2: avoid computing the Krylov matrix

- ▶ Compute iteratively from 1-shifted form to d_1 -shifted form
- ▶ each diagonal block appears in the increasing degree
- ▶ until the shifted Hessenberg form is obtained:

Approach 2: avoid computing the Krylov matrix

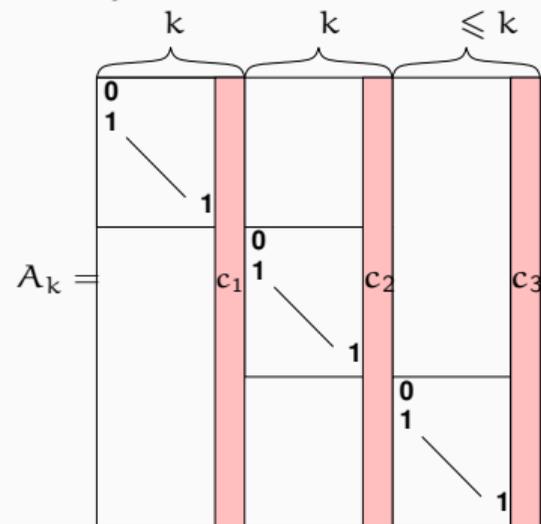

- ▶ Compute iteratively from 1-shifted form to d_1 -shifted form
- ▶ each diagonal block appears in the increasing degree
- ▶ until the shifted Hessenberg form is obtained:

How to transform from k to $k + 1$ -shifted form ?

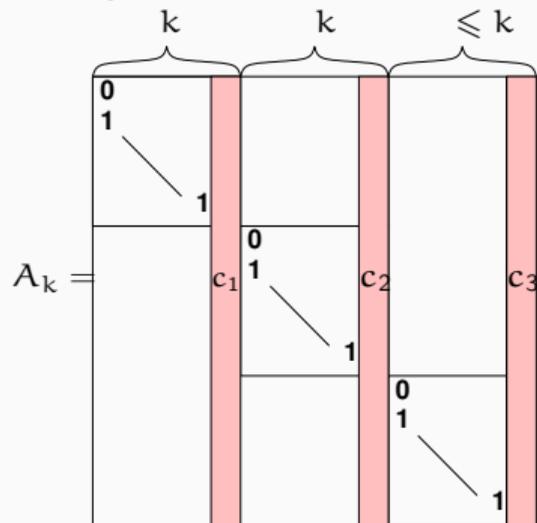

Approach 2: avoid computing the Krylov matrix

for any k -shifted form

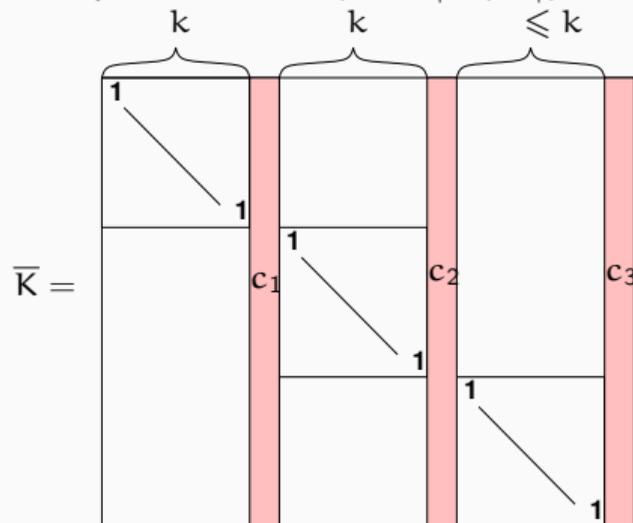

Approach 2: avoid computing the Krylov matrix

for any k -shifted form

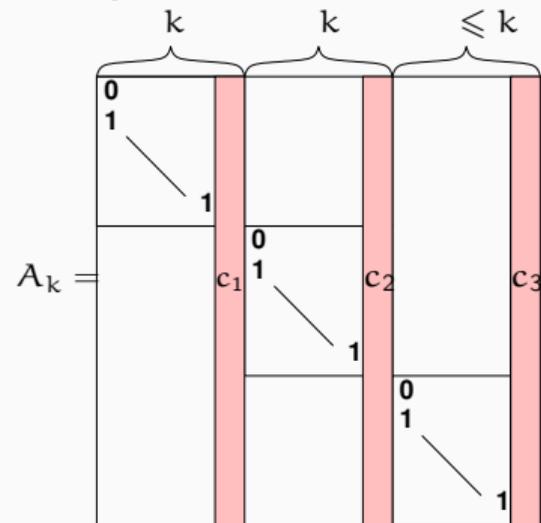

compute the $m \times (m + \lceil m/k \rceil)$ matrix

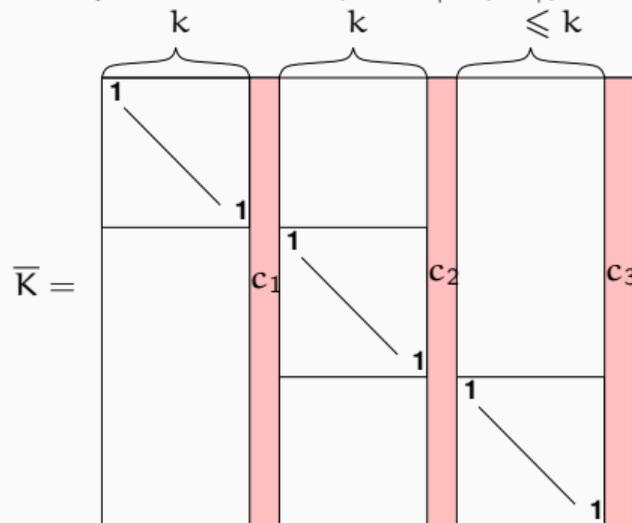

Approach 2: avoid computing the Krylov matrix

for any k -shifted form

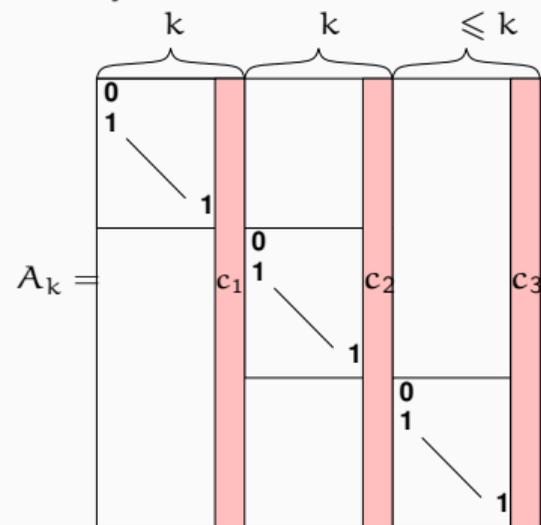

compute the $m \times (m + \lceil m/k \rceil)$ matrix

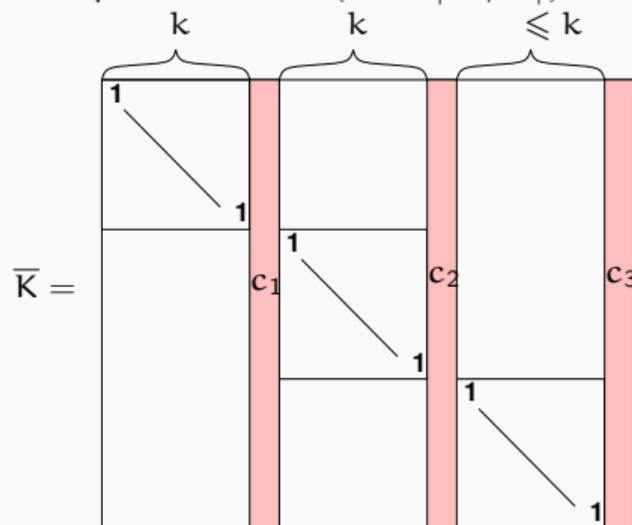

► $\mathbf{K} =$ first linearly indep. cols of $\bar{\mathbf{K}}$

Approach 2: avoid computing the Krylov matrix

for any k -shifted form

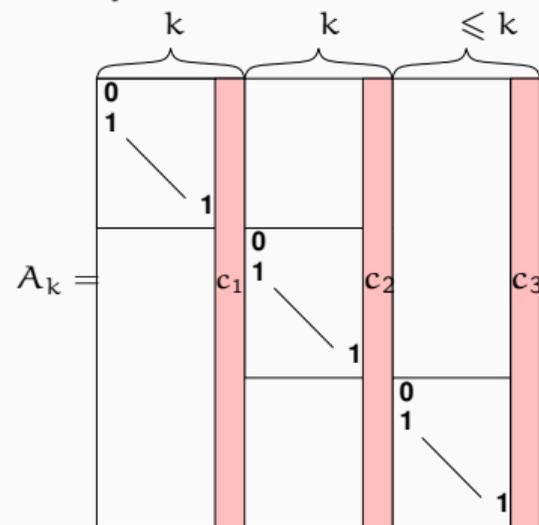

compute the $m \times (m + \lceil m/k \rceil)$ matrix

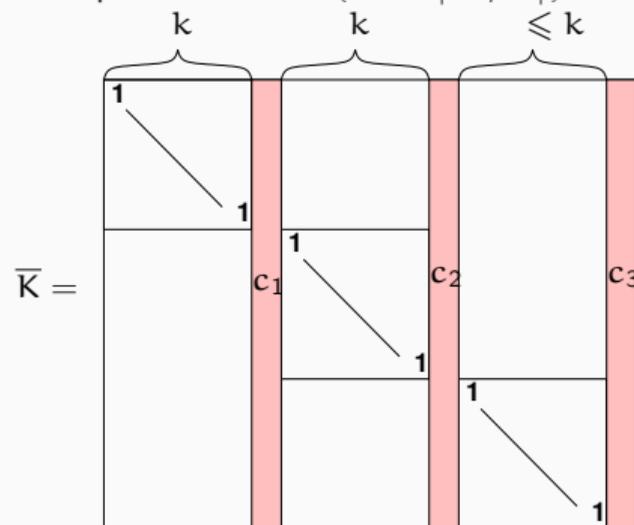

- ▶ $\mathbf{K} =$ first linearly indep. cols of $\bar{\mathbf{K}}$
- ▶ $\mathbf{A}_{k+1} = \mathbf{K}^{-1} \mathbf{A}_k \mathbf{K}$ in $O(m(\frac{m}{k})^{\omega-1})$

Approach 2: avoid computing the Krylov matrix

for any k -shifted form

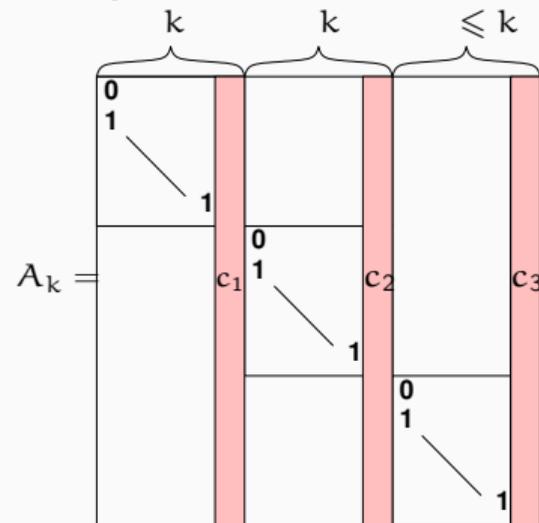

compute the $m \times (m + \lceil m/k \rceil)$ matrix

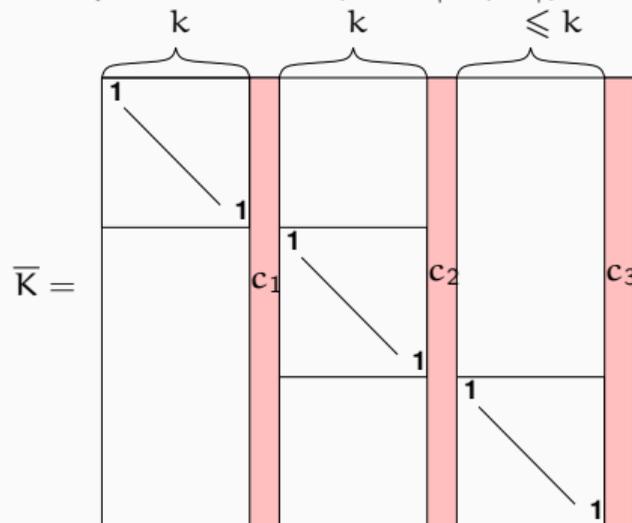

- ▶ $\mathbf{K} =$ first linearly indep. cols of $\bar{\mathbf{K}}$
- ▶ $\mathbf{A}_{k+1} = \mathbf{K}^{-1} \mathbf{A}_k \mathbf{K}$ in $O(m(\frac{m}{k})^{\omega-1})$
- ▶ Overall cost $T(m) = O(m^\omega \sum_{k=1}^m \frac{1}{k^{\omega-1}}) = O(m^\omega)$

Approach 2: avoid computing the Krylov matrix

for any k -shifted form

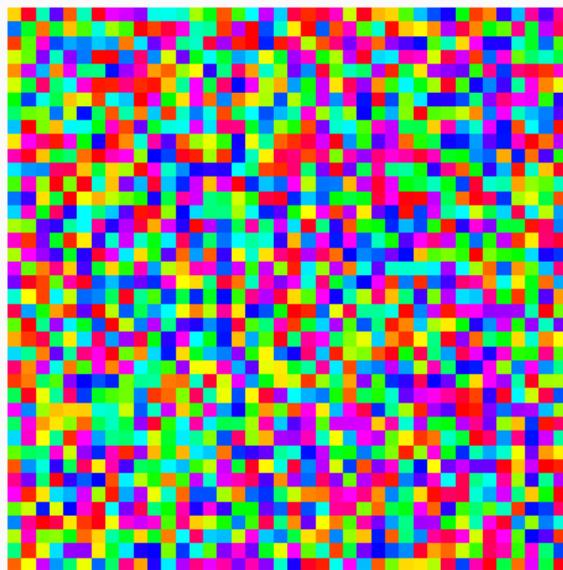

compute the $m \times (m + \lceil m/k \rceil)$ matrix

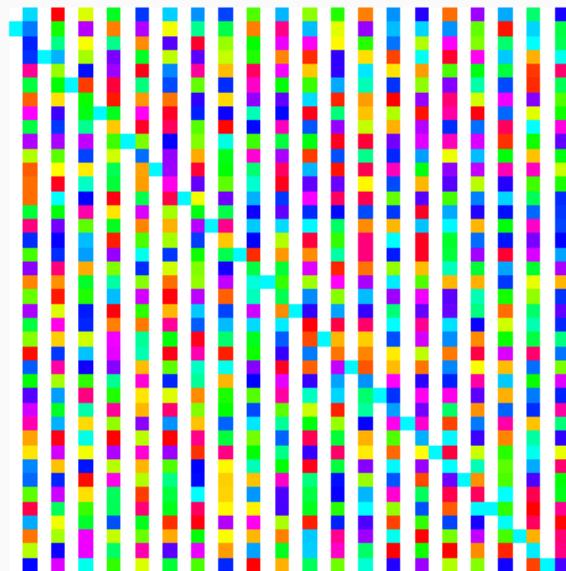

- ▶ \mathbf{K} = first linearly indep. cols of $\bar{\mathbf{K}}$
- ▶ $\mathbf{A}_{k+1} = \mathbf{K}^{-1} \mathbf{A}_k \mathbf{K}$ in $O(m(\frac{m}{k})^{\omega-1})$
- ▶ Overall cost $T(m) = O(m^\omega \sum_{k=1}^m \frac{1}{k^{\omega-1}}) = O(m^\omega)$

w.h.p. \mathbf{K} = first m cols of $\bar{\mathbf{K}}$
w.h.p. \mathbf{A}_{k+1} is $(k+1)$ -shifted

► implementations in the `fflas-ffpack` library¹: finite field dense linear algebra

¹<https://github.com/linbox-team/fflas-ffpack>

Via polynomial matrix arithmetic

Charpoly via $\mathbb{K}[x]$ -linear algebra

Determinant of a matrix $\mathbf{A} \in \mathbb{K}[x]^{m \times m}$ of degree d

$d = 1$

Evaluation-Interpolation: [folklore]

$O(m^{\omega+1})$

at $\sim m \cdot d$ points: requires large enough field

Diagonalization (Smith form): [Storjohann 2003]

$O(m^{\omega} \log(m)^2)$

Las Vegas randomized + additional logs for small fields

Partial triangularization:

▶ Iterative [Mulders-Storjohann 2003]

$O(m^3)$

via weak Popov form computations

▶ Divide and conquer, **generic** [Giorgi-Jeannerod-Villard 2003]

$O(m^{\omega})$

diagonal of Hermite form must be $1, \dots, 1, \det(\mathbf{A})$

▶ Divide and conquer [Labahn-Neiger-Zhou 2017]

$\tilde{O}(m^{\omega})$

logarithmic factors **in** m and d

Partial block triangularization

[Mulders-Storjohann 2003, Giorgi-Jeannerod-Villard 2003, Zhou 2012, Labahn-Neiger-Zhou 2017]

Triangularization of $m \times m$ matrix \mathbf{A} using $m/2 \times m/2$ blocks

not computed

$$\begin{bmatrix} * & * \\ \mathbf{K}_1 & \mathbf{K}_2 \end{bmatrix} \begin{bmatrix} \mathbf{A}_1 & \mathbf{A}_2 \\ \mathbf{A}_3 & \mathbf{A}_4 \end{bmatrix} = \begin{bmatrix} \mathbf{R} & * \\ \mathbf{0} & \mathbf{B} \end{bmatrix}$$

kernel basis of $\begin{bmatrix} \mathbf{A}_1 \\ \mathbf{A}_3 \end{bmatrix}$

$$\mathbf{K}_1 \mathbf{A}_2 + \mathbf{K}_2 \mathbf{A}_4$$

row basis of $\begin{bmatrix} \mathbf{A}_1 \\ \mathbf{A}_3 \end{bmatrix}$

$$\text{Property: } \det(\mathbf{A}) = \det(\mathbf{R}) \det(\mathbf{B})$$

Generic case without log factor

[Mulders-Storjohann 2003, Giorgi-Jeannerod-Villard 2003, Zhou 2012, Labahn-Neiger-Zhou 2017]

Triangularization of $m \times m$ matrix \mathbf{A} using $m/2 \times m/2$ blocks

$$\begin{array}{c} \text{not computed} \\ \left[\begin{array}{cc} * & * \\ \mathbf{K}_1 & \mathbf{K}_2 \end{array} \right] \left[\begin{array}{cc} \mathbf{A}_1 & \mathbf{A}_2 \\ \mathbf{A}_3 & \mathbf{A}_4 \end{array} \right] = \left[\begin{array}{cc} \mathbf{R} & * \\ \mathbf{0} & \mathbf{B} \end{array} \right] \end{array}$$

$\mathbf{K}_1 \mathbf{A}_2 + \mathbf{K}_2 \mathbf{A}_4$

kernel basis of $\begin{bmatrix} \mathbf{A}_1 \\ \mathbf{A}_3 \end{bmatrix}$ row basis of $\begin{bmatrix} \mathbf{A}_1 \\ \mathbf{A}_3 \end{bmatrix}$

$$\text{Property: } \det(\mathbf{A}) = \det(\mathbf{R}) \det(\mathbf{B})$$

Generic input $\Rightarrow \det(\mathbf{A})$ without $\log(m)$

[Giorgi-Jeannerod-Villard 2003]

\mathbf{A}_1 and \mathbf{A}_3 are coprime $\Rightarrow \mathbf{R} = \mathbf{I}_{m/2} \Rightarrow \det(\mathbf{A}) = \det(\mathbf{B})$

- ▶ Compute kernel $[\mathbf{K}_1 \ \mathbf{K}_2]$; deduce \mathbf{B} by MatMul
- ▶ Recursively, compute $\det(\mathbf{B})$, return it

$O(m^\omega M'(d))$

\mathbf{A} and $[\mathbf{K}_1 \ \mathbf{K}_2]$ have degree $d \Rightarrow \mathbf{B}$ has degree $2d$: controlled total degree

General case with log factor

[Mulders-Storjohann 2003, Giorgi-Jeanerod-Villard 2003, Zhou 2012, Labahn-Neiger-Zhou 2017]

Triangularization of $m \times m$ matrix \mathbf{A} using $m/2 \times m/2$ blocks

$$\begin{array}{c} \text{not computed} \\ \left[\begin{array}{cc} * & * \\ \mathbf{K}_1 & \mathbf{K}_2 \end{array} \right] \left[\begin{array}{cc} \mathbf{A}_1 & \mathbf{A}_2 \\ \mathbf{A}_3 & \mathbf{A}_4 \end{array} \right] = \left[\begin{array}{cc} \mathbf{R} & * \\ \mathbf{0} & \mathbf{B} \end{array} \right] \end{array}$$

$\mathbf{K}_1 \mathbf{A}_2 + \mathbf{K}_2 \mathbf{A}_4$

kernel basis of $\begin{bmatrix} \mathbf{A}_1 \\ \mathbf{A}_3 \end{bmatrix}$ row basis of $\begin{bmatrix} \mathbf{A}_1 \\ \mathbf{A}_3 \end{bmatrix}$

$$\text{Property: } \det(\mathbf{A}) = \det(\mathbf{R}) \det(\mathbf{B})$$

Matrix degree not controlled: degree of \mathbf{B} up to $D = \sum \text{rdeg}(\mathbf{A}) \leq md$
but controlled average row degree: at most $\frac{D}{m}$

General input $\Rightarrow \det(\mathbf{A})$ in $O^\sim(m^\omega \frac{D}{m})$

[Labahn-Neiger-Zhou 2017]

▶ Compute kernel $[\mathbf{K}_1 \ \mathbf{K}_2]$; deduce \mathbf{B} by MatMul

$O(m^\omega M'(\frac{D}{m}))$

▶ Compute row basis \mathbf{R}

$O^\sim(m^\omega \frac{D}{m})$ with $\log(m)$

▶ Recursively, compute $\det(\mathbf{R})$ and $\det(\mathbf{B})$, return $\det(\mathbf{R}) \det(\mathbf{B})$

Be lazy: if hard to compute, don't compute

[Mulders-Storjohann 2003, Giorgi-Jeannerod-Villard 2003, Zhou 2012, Labahn-Neiger-Zhou 2017]

Triangularization of $m \times m$ matrix \mathbf{A} using $m/2 \times m/2$ blocks

$$\begin{bmatrix} * & * \\ \mathbf{K}_1 & \mathbf{K}_2 \end{bmatrix} \begin{bmatrix} \mathbf{A}_1 & \mathbf{A}_2 \\ \mathbf{A}_3 & \mathbf{A}_4 \end{bmatrix} = \begin{bmatrix} \mathbf{R} & * \\ \mathbf{0} & \mathbf{B} \end{bmatrix}$$

not computed

kernel basis of $\begin{bmatrix} \mathbf{A}_1 \\ \mathbf{A}_3 \end{bmatrix}$

$\mathbf{K}_1\mathbf{A}_2 + \mathbf{K}_2\mathbf{A}_4$

row basis of $\begin{bmatrix} \mathbf{A}_1 \\ \mathbf{A}_3 \end{bmatrix}$

$$\text{Property: } \det(\mathbf{A}) = \det(\mathbf{R}) \det(\mathbf{B})$$

Obstacle: removing log factors in row basis computation

⇒ solution: **remove row basis computation**

$$\begin{bmatrix} \mathbf{I}_{m/2} & \mathbf{0} \\ \mathbf{K}_1 & \mathbf{K}_2 \end{bmatrix} \begin{bmatrix} \mathbf{A}_1 & \mathbf{A}_2 \\ \mathbf{A}_3 & \mathbf{A}_4 \end{bmatrix} = \begin{bmatrix} \mathbf{A}_1 & \mathbf{A}_2 \\ \mathbf{0} & \mathbf{B} \end{bmatrix}$$

$$\text{Property: } \det(\mathbf{A}) = \det(\mathbf{A}_1) \det(\mathbf{B}) / \det(\mathbf{K}_2)$$

Further obstacles (brought by laziness)

$$\begin{bmatrix} \mathbf{I}_{m/2} & \mathbf{0} \\ \mathbf{K}_1 & \mathbf{K}_2 \end{bmatrix} \begin{bmatrix} \mathbf{A}_1 & \mathbf{A}_2 \\ \mathbf{A}_3 & \mathbf{A}_4 \end{bmatrix} = \begin{bmatrix} \mathbf{A}_1 & \mathbf{A}_2 \\ \mathbf{0} & \mathbf{B} \end{bmatrix}$$

Property: $\det(\mathbf{A}) = \det(\mathbf{A}_1) \det(\mathbf{B}) / \det(\mathbf{K}_2)$

👍 no $\log(m)$ in the computation of \mathbf{A}_1 , \mathbf{B} , \mathbf{K}_2

👎 requires nonsingular \mathbf{A}_1 , otherwise $\det(\mathbf{K}_2) = 0$

👎 3 recursive calls in matrix size $m/2$ is 👍, but requires $\sum \text{rdeg}(\mathbf{A}_1) \leq D/2$

otherwise degree control is too weak.

(this implies $\sum \text{rdeg}(\mathbf{K}_2) \leq D/2$)

Further obstacles (brought by laziness)

$$\begin{bmatrix} \mathbf{I}_{m/2} & \mathbf{0} \\ \mathbf{K}_1 & \mathbf{K}_2 \end{bmatrix} \begin{bmatrix} \mathbf{A}_1 & \mathbf{A}_2 \\ \mathbf{A}_3 & \mathbf{A}_4 \end{bmatrix} = \begin{bmatrix} \mathbf{A}_1 & \mathbf{A}_2 \\ \mathbf{0} & \mathbf{B} \end{bmatrix}$$

Property: $\det(\mathbf{A}) = \det(\mathbf{A}_1) \det(\mathbf{B}) / \det(\mathbf{K}_2)$

- 👍 $\log(m)$ in the computation of \mathbf{A}_1 , \mathbf{B} , \mathbf{K}_2
- 👎 requires nonsingular \mathbf{A}_1 , otherwise $\det(\mathbf{K}_2) = 0$
- 👎 3 recursive calls in matrix size $m/2$ is 👍, but requires $\sum \text{rdeg}(\mathbf{A}_1) \leq D/2$
otherwise degree control is too weak. (this implies $\sum \text{rdeg}(\mathbf{K}_2) \leq D/2$)

Solution: require \mathbf{A} in weak Popov form (the characteristic matrix $\mathbf{A} = x\mathbf{I}_m - \mathbf{M}$ is in Popov form)

- 👍 implies \mathbf{A}_1 nonsingular and $\sum \text{rdeg}(\mathbf{A}_1) \leq D/2$ up to easy transformations
- 👍 both \mathbf{A}_1 and \mathbf{B} are also in weak Popov form \Rightarrow suitable for recursive calls
- 👎 \mathbf{K}_2 is in “shifted reduced” form... find weak Popov \mathbf{P} with same determinant

Complexity

$$\mathcal{C}(m, D) \leq 2\mathcal{C}\left(\frac{m}{2}, \left\lfloor \frac{D}{2} \right\rfloor\right) + \mathcal{C}\left(\frac{m}{2}, D\right) + O(m^\omega M'\left(\frac{D}{m}\right))$$

where: $M(d) = \text{PolMul}(d) = O(d^{\omega-1-\epsilon})$ $M'(d) = \text{GCD}(d) \in O(M(d) \log(d))$

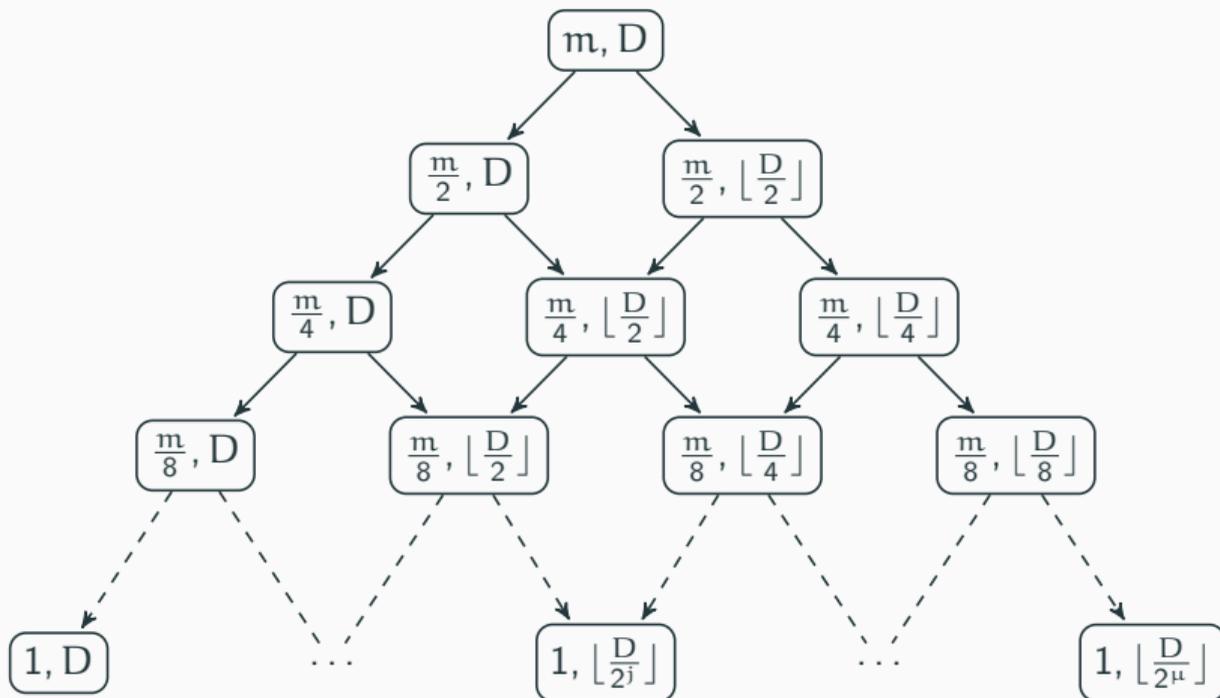

$\frac{D}{m} = \frac{\text{degdet}}{m} = \text{avg row degree}$

Complexity

$$c(m, D) \leq 2c\left(\frac{m}{2}, \left\lfloor \frac{D}{2} \right\rfloor\right) + c\left(\frac{m}{2}, D\right) + O(m^\omega M'\left(\frac{D}{m}\right))$$

where: $M(d) = \text{PolMul}(d) = O(d^{\omega-1-\epsilon})$ $M'(d) = \text{GCD}(d) \in O(M(d) \log(d))$

A deterministic reduction to Matrix multiplication

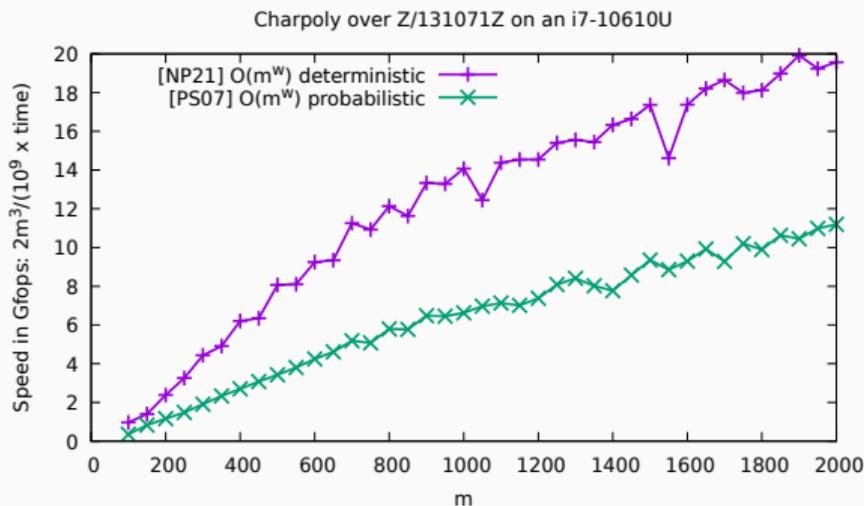

Results [Neiger-P. 21]

- ▶ CharPoly = $\Theta(\text{MatMul}) = \Theta(n^\omega)$ deterministically
- ▶ Determinant of reduced polynomial matrices in $O(m^\omega M'(\frac{D}{m}))$

A deterministic reduction to Matrix multiplication

Results [Neiger-P. 21]

- ▶ CharPoly = $\Theta(\text{MatMul}) = \Theta(n^\omega)$ deterministically
- ▶ Determinant of reduced polynomial matrices in $O(m^\omega M'(\frac{D}{m}))$

- ▶ Prototype incomplete implementation (does not deal with the non-generic cases)

Spin-off result

Lemma

A right kernel basis of $\mathbf{A} \in \mathbb{K}[x]^{m \times O(m)}$ with constant degree can be computed in reduced form in $O(m^\omega)$ field operations.

Spin-off result

Lemma

A right kernel basis of $\mathbf{A} \in \mathbb{K}[x]^{m \times O(m)}$ with constant degree can be computed in reduced form in $O(m^\omega)$ field operations.

Corollary

The Krylov matrix $\mathbf{K}_{\mathbf{A}, \mathbf{v}} = \begin{bmatrix} \mathbf{v} & \mathbf{A}\mathbf{v} & \dots & \mathbf{A}^{m-1}\mathbf{v} \end{bmatrix}$ with $\mathbf{A} \in \mathbb{K}^{m \times m}$ can be computed in $O(m^\omega)$.

Spin-off result

Lemma

A right kernel basis of $\mathbf{A} \in \mathbb{K}[x]^{m \times O(m)}$ with constant degree can be computed in reduced form in $O(m^\omega)$ field operations.

Corollary

The Krylov matrix $\mathbf{K}_{\mathbf{A}, \mathbf{v}} = [\mathbf{v} \quad \mathbf{A}\mathbf{v} \quad \dots \quad \mathbf{A}^{m-1}\mathbf{v}]$ with $\mathbf{A} \in \mathbb{K}^{m \times m}$ can be computed in $O(m^\omega)$.

Sketch of proof.

$$\left[\mathbf{I}_m - x\mathbf{A} \mid -\mathbf{v} \right] \begin{bmatrix} \mathbf{s} \\ \mathbf{t} \end{bmatrix} = 0$$

Hence

$$\mathbf{s}/\mathbf{t} = (\mathbf{I}_m - x\mathbf{A})^{-1}\mathbf{v} = \sum_{i=0}^{\infty} x^i \mathbf{A}^i \mathbf{v}.$$

A truncated series expansion of \mathbf{s}/\mathbf{t} at order m produces the Krylov iterates. □

Via Block-Wiedemann's algorithm

Block-Wiedemann approach

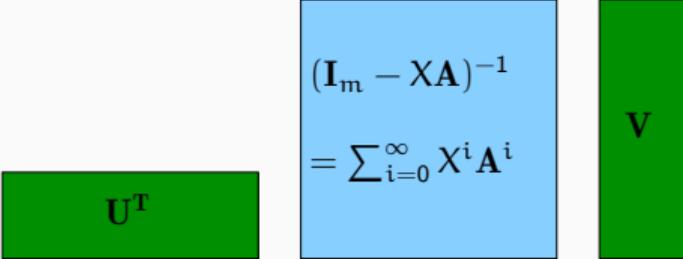

$$\det(\lambda \mathbf{I}_m - \mathbf{A}) = 1/\chi^m \det(\mathbf{I}_m - \chi \mathbf{A}) \text{ for } \chi = 1/\lambda$$

$$\begin{aligned} &(\mathbf{I}_m - \chi \mathbf{A})^{-1} \\ &= \sum_{i=0}^{\infty} \chi^i \mathbf{A}^i \end{aligned}$$

Block-Wiedemann approach

$$\det(\lambda \mathbf{I}_m - \mathbf{A}) = 1/X^m \det(\mathbf{I}_m - X\mathbf{A}) \text{ for } X = 1/\lambda$$

1. Sample unif. $\mathbf{U}, \mathbf{V} \in \mathbb{K}^{m \times k}$
2. For all $i \in \{0, \dots, 2m/k\}$ Compute $\mathbf{U}^T \mathbf{A}^i \mathbf{V}$

\mathbf{U}^T

$$\begin{aligned} &(\mathbf{I}_m - X\mathbf{A})^{-1} \\ &= \sum_{i=0}^{\infty} X^i \mathbf{A}^i \end{aligned}$$

\mathbf{V}

Block-Wiedemann approach

$$\det(\lambda \mathbf{I}_m - \mathbf{A}) = 1/X^m \det(\mathbf{I}_m - X\mathbf{A}) \text{ for } X = 1/\lambda$$

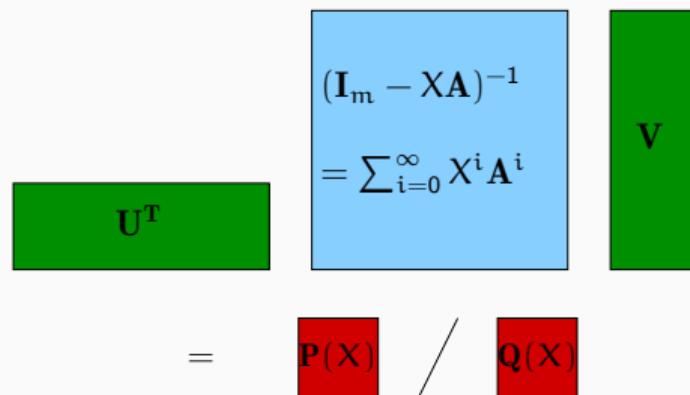

1. Sample unif. $\mathbf{U}, \mathbf{V} \in \mathbb{K}^{m \times k}$
2. For all $i \in \{0, \dots, 2m/k\}$ Compute $\mathbf{U}^T \mathbf{A}^i \mathbf{V}$
3. Reconstruct a matrix fraction
 $\mathbf{P}(X)/\mathbf{Q}(X) = \mathbf{U}^T (\mathbf{I}_m - X\mathbf{A})^{-1} \mathbf{V}$

$$\begin{array}{ccc} \mathbf{U}^T & (\mathbf{I}_m - X\mathbf{A})^{-1} & \mathbf{V} \\ & = \sum_{i=0}^{\infty} X^i \mathbf{A}^i & \\ & = \mathbf{P}(X) / \mathbf{Q}(X) & \end{array}$$

Block-Wiedemann approach

$$\det(\lambda \mathbf{I}_m - \mathbf{A}) = 1/X^m \det(\mathbf{I}_m - X\mathbf{A}) \text{ for } X = 1/\lambda$$

1. Sample unif. $\mathbf{U}, \mathbf{V} \in \mathbb{K}^{m \times k}$
2. For all $i \in \{0, \dots, 2m/k\}$ Compute $\mathbf{U}^T \mathbf{A}^i \mathbf{V}$
3. Reconstruct a matrix fraction
 $\mathbf{P}(X)/\mathbf{Q}(X) = \mathbf{U}^T (\mathbf{I}_m - X\mathbf{A})^{-1} \mathbf{V}$
4. Return $\det \mathbf{Q}(X)$ ($= \det(\mathbf{I}_m - X\mathbf{A})$ w.h.p.)

$$\mathbf{U}^T (\mathbf{I}_m - X\mathbf{A})^{-1} \mathbf{V} = \mathbf{P}(X) / \mathbf{Q}(X)$$

[Karpman-P.-Signargout-Villard 21] based on [Villard 18]

1. Structured inversion modulo $\chi^{2m/k}$:
 $(\mathbf{I}_m - \chi\mathbf{A})^{-1} = \sum_{i=1}^{\alpha} \tilde{\mathbf{L}}_i \tilde{\mathbf{U}}_i \pmod{\chi^{2m/k}}$

Block Wiedemann algorithm with rank displacement structure

Implicit iteration using structured inverse

[Karpman-P.-Signargout-Villard 21] based on [Villard 18]

► Structured projections: $\mathbf{U} = \mathbf{V} = \begin{bmatrix} \mathbf{I}_k \\ \mathbf{0} \end{bmatrix} \in \mathbb{K}^{m \times k}$

1. Structured inversion modulo $\chi^{2m/k}$:
 $(\mathbf{I}_m - \chi \mathbf{A})^{-1} = \sum_{i=1}^{\alpha} \tilde{\mathbf{L}}_i \tilde{\mathbf{U}}_i \pmod{\chi^{2m/k}}$
2. Crop : $\begin{bmatrix} \mathbf{I}_k & \mathbf{0} \end{bmatrix} \sum \tilde{\mathbf{L}}_i \tilde{\mathbf{U}}_i \begin{bmatrix} \mathbf{I}_k \\ \mathbf{0} \end{bmatrix} = \sum_{i=1}^{\alpha} (\tilde{\mathbf{L}}_i)_{1..k,1..k} (\tilde{\mathbf{U}}_i)_{1..k,1..k}$

Block Wiedemann algorithm with rank displacement structure

Implicit iteration using structured inverse

[Karpman-P.-Signargout-Villard 21] based on [Villard 18]

- Structured projections: $\mathbf{U} = \mathbf{V} = \begin{bmatrix} \mathbf{I}_k \\ \mathbf{0} \end{bmatrix} \in \mathbb{K}^{m \times k}$

$$\sum_{i=1}^{\alpha} \hat{\mathbf{L}}_i \hat{\mathbf{U}}_i$$

1. Structured inversion modulo $\chi^{2m/k}$:
 $(\mathbf{I}_m - \chi \mathbf{A})^{-1} = \sum_{i=1}^{\alpha} \tilde{\mathbf{L}}_i \tilde{\mathbf{U}}_i \pmod{\chi^{2m/k}}$
2. Crop : $\begin{bmatrix} \mathbf{I}_k & \mathbf{0} \end{bmatrix} \sum \tilde{\mathbf{L}}_i \tilde{\mathbf{U}}_i \begin{bmatrix} \mathbf{I}_k \\ \mathbf{0} \end{bmatrix} = \sum_{i=1}^{\alpha} (\tilde{\mathbf{L}}_i)_{1..k,1..k} (\tilde{\mathbf{U}}_i)_{1..k,1..k}$

Block Wiedemann algorithm with rank displacement structure

Implicit iteration using structured inverse

[Karpman-P.-Signargout-Villard 21] based on [Villard 18]

► Structured projections: $\mathbf{U} = \mathbf{V} = \begin{bmatrix} \mathbf{I}_k \\ \mathbf{0} \end{bmatrix} \in \mathbb{K}^{m \times k}$

S

1. Structured inversion modulo $\chi^{2m/k}$:
 $(\mathbf{I}_m - \chi \mathbf{A})^{-1} = \sum_{i=1}^{\alpha} \tilde{\mathbf{L}}_i \tilde{\mathbf{U}}_i \pmod{\chi^{2m/k}}$
2. Crop : $\begin{bmatrix} \mathbf{I}_k & \mathbf{0} \end{bmatrix} \sum \tilde{\mathbf{L}}_i \tilde{\mathbf{U}}_i \begin{bmatrix} \mathbf{I}_k \\ \mathbf{0} \end{bmatrix} = \sum_{i=1}^{\alpha} (\tilde{\mathbf{L}}_i)_{1..k,1..k} (\tilde{\mathbf{U}}_i)_{1..k,1..k}$
3. Expand to dense

Block Wiedemann algorithm with rank displacement structure

Implicit iteration using structured inverse

[Karpman-P.-Signargout-Villard 21] based on [Villard 18]

► Structured projections: $\mathbf{U} = \mathbf{V} = \begin{bmatrix} \mathbf{I}_k \\ \mathbf{0} \end{bmatrix} \in \mathbb{K}^{m \times k}$

$$\mathbf{S}$$

$$= \mathbf{P}(X) / \mathbf{Q}(X)$$

1. Structured inversion modulo $X^{2m/k}$:
 $(\mathbf{I}_m - X\mathbf{A})^{-1} = \sum_{i=1}^{\alpha} \tilde{\mathbf{L}}_i \tilde{\mathbf{U}}_i \pmod{X^{2m/k}}$
2. Crop : $\begin{bmatrix} \mathbf{I}_k & \mathbf{0} \end{bmatrix} \sum \tilde{\mathbf{L}}_i \tilde{\mathbf{U}}_i \begin{bmatrix} \mathbf{I}_k \\ \mathbf{0} \end{bmatrix} = \sum_{i=1}^{\alpha} (\tilde{\mathbf{L}}_i)_{1..k,1..k} (\tilde{\mathbf{U}}_i)_{1..k,1..k}$
3. Expand to dense
4. Reconstruct a matrix fraction: $\mathbf{S} = \mathbf{P}/\mathbf{Q}$

Block Wiedemann algorithm with rank displacement structure

Implicit iteration using structured inverse

[Karpman-P.-Signargout-Villard 21] based on [Villard 18]

- ▶ Structured projections: $\mathbf{U} = \mathbf{V} = \begin{bmatrix} \mathbf{I}_k \\ \mathbf{0} \end{bmatrix} \in \mathbb{K}^{m \times k}$

$$= \begin{matrix} \boxed{\mathbf{S}} \\ \\ \boxed{\mathbf{P}(X)} \ / \ \boxed{\mathbf{Q}(X)} \end{matrix}$$

- ▶ Generic algorithm
- ▶ Applies to Toeplitz-like, Hankel-like and Toeplitz-like+Hankel-like
- ▶ $\tilde{O}(m^{c(\omega)} \alpha^{\omega - c(\omega)})$ with $c(\omega) = 2 - 1/\omega$

1. Structured inversion modulo $X^{2m/k}$:

$$(\mathbf{I}_m - X\mathbf{A})^{-1} = \sum_{i=1}^{\alpha} \tilde{\mathbf{L}}_i \tilde{\mathbf{U}}_i \pmod{X^{2m/k}}$$

2. Crop : $\begin{bmatrix} \mathbf{I}_k & \mathbf{0} \end{bmatrix} \sum \tilde{\mathbf{L}}_i \tilde{\mathbf{U}}_i \begin{bmatrix} \mathbf{I}_k \\ \mathbf{0} \end{bmatrix} =$

$$\sum_{i=1}^{\alpha} (\tilde{\mathbf{L}}_i)_{1..k,1..k} (\tilde{\mathbf{U}}_i)_{1..k,1..k}$$

3. Expand to dense
4. Reconstruct a matrix fraction: $\mathbf{S} = \mathbf{P}/\mathbf{Q}$
5. Return $\text{Det}(\mathbf{Q})$

→ $\tilde{O}(m^{1.58} \alpha^{0.53})$

Open problems

Open Problems

Dense matrices over a field

- ▶ Is fast polynomial arithmetic ($M(d) = O(d^{\omega-1-\varepsilon})$) required for charpoly in $O(m^\omega)$?

Dense matrices over a field

- ▶ Is fast polynomial arithmetic ($M(d) = O(d^{\omega-1-\epsilon})$) required for charpoly in $O(m^\omega)$?
- ▶ MinPoly vs CharPoly:
 - ◊ Earlier algorithms: MinPoly often a step towards CharPoly
 - ◊ [P.-Storjohann 07]: MinPoly deduced from the probabilistic $O(m^\omega)$ CharPoly
 - ◊ [Neiger-P. 21]: MinPoly no longer deducible from the deterministic $O(m^\omega)$ CharPoly
